

SolDevelo's Case Study and Project Information

Product

SMSSync is a simple, yet powerful SMS to HTTP sync utility that turns any Android phone into a local SMS gateway by sending incoming messages(SMS) to a configured URL (web service). SMSSync is licensed under LGPL (GNU Lesser General Public License, v.3)

Our Involvement

SolDevelo's team was a pillar of Version v2.6 release. We managed to successfully improve and develop key features of the application and fixed main bugs. We help to improve and develop SMSSync application. Our team particularly improved: Action bar, Task messages, Status codes and more. We also fixed main bugs and crashing issues.

Features

- Replaced Action Bar Sherlock library with ActionBarCompat support library.
- Replaced dropdown widget which is used for setting the frequencies for the schedulers with a time picker widget.
- Task messages appear in the pending tray before they are attempted to be sent as SMS.
- Sent and delivered SMS status codes are processed.
- Action Bar Contextual Menu with 'selected' appended to the selection count label.
